

# Instability of Teacher Effects Estimates from Value-Added Models

Edward Haertel

School of Education, Stanford University

*CTC / PACE Symposium on*

**Linking Teaching with Learning: Examining Value Added  
Assessment Methodology for California**

October 6, 2008

*These preliminary findings are from work in progress, as reported at AERA (2008). I wish to acknowledge the contributions of my co-authors:*

- ▶ Linda Darling-Hammond  
Stanford University
- ▶ Xiaoxia Newton  
University of California at Berkeley
- ▶ Ewart Thomas  
Stanford University

- ▶ Teachers for a New Era (TNE) longitudinal study offered opportunity to look closely at stability of teacher effects estimates
  - Using alternative statistical models
  - Teaching different courses
  - From year to year

# Small Sample, Rich Data— TNE Study Includes:

- ▶ STEP and non-STEP teachers of HS Math and ELA
- ▶ Longitudinal data (full data for 2005-06 and 2006-07, as well as prior-year achievement)
- ▶ Variables describing
  - teacher preservice preparation
  - teaching assignments
  - student characteristics
  - student outcomes

**Table 1: List of Sample for Math and ELA for the VAM Analysis**

Academic Year Sample	2005-06	2006-07
Math teacher-course combinations <sup>a</sup>	57	46
ELA teacher-course combinations <sup>b</sup>	51	63
Students		
Grade 9	646	881
Grade 10	714	693
Grade 11	511	789

<sup>a</sup> Some teachers taught multiple courses. There were 13 such math teachers for year 2005-06 and 10 for year 2006-07.

<sup>b</sup> The numbers of ELA teachers who taught multiple English courses for the two years were 16 and 15 respectively.

# Our “Value-Added” Models

- ▶ OLS regressions assessing teachers’ value-added student achievement controlling for:
  - Model 1: students’ prior achievement only
  - Model 2: prior achievement plus demographics
  - Model 3: prior achievement plus school (as fixed effect)
  - Model 4: prior achievement plus demographics plus school (as fixed effect)

# Findings

- ▶ Teachers' effectiveness rankings vary considerably, according to:
  - The statistical model used
  - The course taught
  - The year measured

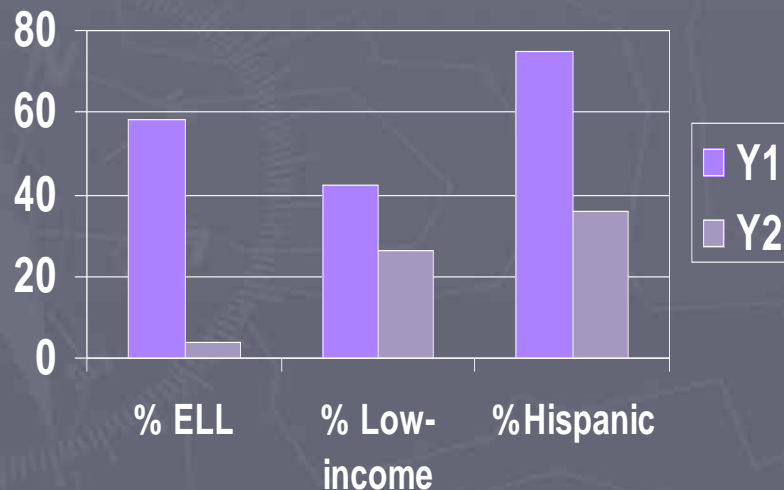

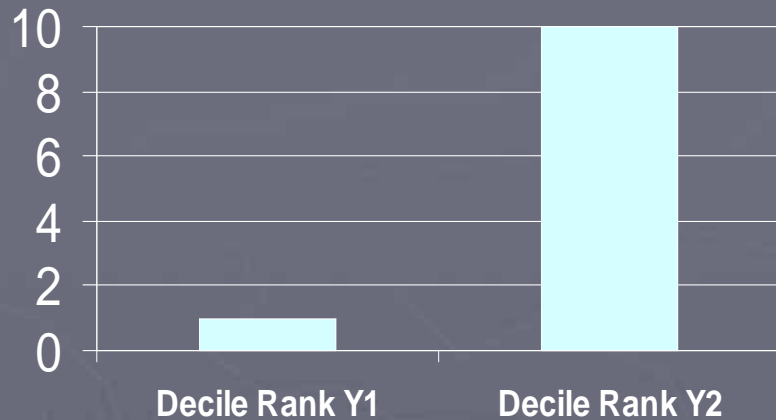

# % of Teachers Whose Effectiveness Ratings Change

	By at least 1 decile	By at least 2 deciles	By at least 3 deciles
Across models*	56-80%	12-33%	0-14%
Across courses*	85-100%	54-92%	39-54%
Across years*	74-93%	45-63%	19-41%

\*Depending on the model

# One Extreme Case: An English language arts teacher

- ▶ Comprehensive high school
- ▶ Not a beginning teacher
- ▶ White
- ▶ Teaching English I
- ▶ Estimate controls for:
  - Prior achievement
  - Demographics
  - School fixed effect

# What Have We Learned?

- ▶ Measures of teacher effects are not highly stable, and may depend on
  - Student backgrounds
  - School contexts
  - Different courses (as these intersect with teacher skills and / or student backgrounds?)
  - Different years (as these represent experience, context, course, or student differences?)
- ▶ More research is needed to ascertain what we are actually measuring when we seek to measure a “teacher effect”
- ▶ Validity of VAM teacher effect estimates for high stakes inferences is not yet established

# Differences across Models

Differences in teachers' ratings across models are significantly correlated with the characteristics of their students, including:

- ▶ Free / reduced price lunch status
- ▶ English language learner status
- ▶ Race / ethnicity (proportion of African American, Asian, Latino students)
- ▶ Parent education
- ▶ "On track" status for math course taken

# Differences Across Courses

Individual teachers are rated differently when teaching different classes.

- ▶ For most models, ratings of effectiveness for the same teacher across two courses are not significantly correlated
- ▶ In 16 cases where several teachers were teaching the same 2 different courses, ANOVA (with prior test score controls) found that the course was more often a significant predictor of student achievement (11 cases) than the teacher (3 cases).

# Differences Across Years

- ▶ While correlations of teacher ratings were significantly correlated across years ( $r = .3$  to  $.4$  across models in ELA and  $.4$  to  $.6$  in math), there were still noticeable changes in teachers "effectiveness" scores from one year to the next.

The background of the slide is a dark blue-grey color with a faint, light-colored topographic map pattern. The map features contour lines and a compass rose in the lower-left corner. The compass rose has a needle pointing towards the top-left, with the letters 'N', 'S', 'E', and 'W' visible. The text "Thank you" is centered in a white, sans-serif font.

Thank you
